UnsatisfiableError: The following specifications were found to be incompatible with the existing python installation in your environment:

Specifications:

- python-dateutil -> python[version='>=3.8,<3.9.0a0|>=3.9,<3.10.0a0']

Your python: python=3.7

If python is on the left-most side of the chain, that's the version you've asked for.

When python appears to the right, that indicates that the thing on the left is somehow

not available for the python version you are constrained to. Note that conda will not

change your python version to a different minor version unless you explicitly specify

that.

The following specifications were found to be incompatible with each other:

Output in format: Requested package -> Available versions
